

If you're in the terminal industry, your main line of business is to store or move the product. No matter if you're in the tank farm, or working the pipelines, or even loading/unloading a barge, we've got just the product for you.

Whether it's rubber or metal, we can recommend the right hose for your application. We normally see the following assemblies needed in this particular industry:

## **COMPOSITE HOSE**

- With no welding in the design, this hose is less likely to crack
- Light weight
- Multiple layers keep this hose from aging failure

## **DOCK HOSE**

- Extreme temperatures are no match
- Can handle aggressive chemicals
- Fire safe
- Gases don't permate the

## **METAL HOSE**

- Kink resistant
- Multiple high tensile nylon cods with helix steel wire embedded
- Covered with weather, ozone, and oil-resistant Neoprene

## **GASKETS**

- Standard or custom cut sheet gaskets
- Metal gaskets

We're not just limited to hose assemblies. Expansion joints can relieve stress in piping systems and prevent gaskets from being crushed.

Their high temperature combined with high pressure will absorb vibration while allowing movement.
